EXP 10: Performance Optimization in Zoho Creator

AIM

To study and implement performance optimization techniques in Zoho Creator to improve application speed, reduce loading time, minimize unnecessary workflows, and enhance the overall efficiency of the Event Registration Management System.

PROBLEM STATEMENT

An event organization uses a Zoho Creator application to manage event details, participant information, registration records, and registration status. As the number of registrations increases, the system may become slow because reports retrieve unnecessary records and multiple workflows perform similar operations.

SOLUTION

Performance optimization techniques are proposed to improve the application's response time and efficiency.

• **Report Optimization:** Apply filters to display only relevant event and participant registration records.

• **Workflow Optimization:** Remove duplicate workflows and avoid unnecessary triggers for registration status updates.

• **Deluge Script Optimization:** Reduce repeated database queries and simplify conditions in registration-related scripts.

• **Form Optimization:** Include only necessary event registration fields and validations.

• **Data Retrieval Optimization:** Fetch only the required event and participant records and fields.

• **Testing:** Compare application performance before and after optimization.

Expected Result: The Event Registration Management System should load reports faster, execute workflows more efficiently, and provide a better user experience.

EXPECTED OBSERVATION

S. No.	Observation	Result
1	Initial application performance	Reports may load slowly
2	Filters applied to event registration reports	Only relevant event and participant records are displayed
3	Duplicate workflows removed	Unnecessary executions are reduced
4	Deluge scripts optimized	Redundant operations are minimized
5	Application tested after optimization	Improved efficiency is expected

PROCEDURE

1. Log in to Zoho Creator and open the Event Registration Management System.
2. Identify performance issues in the Event Registration form, reports, and workflows.
3. Apply filters to reports to retrieve only the required event and participant registration records.
4. Review duplicate workflows and optimize Deluge scripts where necessary.
5. Reduce unnecessary data retrieval and processing.
6. Test the application and compare its performance before and after optimization.

RESULT

Performance optimization techniques in Zoho Creator were studied for the Event Registration Management System. The proposed optimization methods help reduce unnecessary processing, improve report response time, and increase application efficiency.

CONCLUSION

Thus, performance optimization in Zoho Creator was studied successfully. By optimizing event registration reports, workflows, Deluge scripts, and data retrieval, the application's performance and responsiveness can be improved, resulting in efficient event registration management and a better user experience.
